

Making private AI use visible.

Peer-led AI workflow sharing — so the 460 can learn from the 40.

01 · THE PROBLEM

Chico.ai measures the adoption gap. It does not close it.

On a typical Chico.ai install, 40 of 500 users drive most AI activity. The dashboard tells leadership who is and isn't using AI. It does not give the other 460 a reason — or a way — to start. Training and mandates are the default response, and the default response is failing.

88%

of heavy AI users name peers as the strongest influence on their workflow — vs 50% of light users.

Microsoft Research, 2026

02 · THE INSIGHT

Prescribed recipes replicate the threat. Peer discovery honours expertise.

Top-down playbooks tell people their existing way of working is wrong. That triggers identity threat — and shadow AI. Peer-led discovery flips it: active users share what already works, in their own words. Non-adopters find role-relevant proof, on their own terms, with no manager visibility and no mandate. Visibility, not training, is the gap.

03 · THE PRODUCT

Three surfaces, one motion.

CAPTURE

Active users post a workflow in under 90 seconds — task, AI used, tip, time saved. Opt-in only.

FEED

Non-adopters browse role-filtered workflows from peers. No leaderboards, no manager view.

DETAIL

Each workflow shows the prompt, the steps, who shared it, and a one-tap 'try this' handoff.

04 · THE PILOT

Concierge first. Engineer later.

Wks 1-2

Capture by hand. Five sharers. Five published workflows. Zero new code.

Wks 3-4

Surface to ~60 matched peers. Measure activation rate (≥ 2 AI uses in 7 days).

05 · THE ROI

£358,800 per enterprise client, annualised.

69 newly-active peers $\times$ 2 hrs saved / week $\times$ £50 blended rate

£6,900 / week

Conservative 15% activation against the 460 non-active pool. Reconciles with the deck's RoiModel slide and the admin view.

06 · RISKS

What could break the bet.

- Active users don't share. Mitigation: concierge-curate the first batch by hand.
- Workflows feel performative. Mitigation: short form, opt-in, no leaderboard.
- Manager surveillance creeps in. Mitigation: contributor identity stays opt-in at admin layer.

07 · WHAT I'D DO NEXT

After the pilot proves it.

- Capture-in-flow: Slack and Notion integrations so workflows post themselves.
- Manager digest: model behaviour via examples, never mandate via dashboards.
- Anti-spam: rate-limit, auto-archive stale workflows, peer-flagged quality signal.
